On October 17, 2017, the U.S. Department of Energy's (DOE) Office of Fossil Energy issued a \$26 million funding opportunity announcement (FOA) for cost-shared research and development projects that support the DOE Carbon Capture Program's goal of broad, cost-effective carbon capture deployment. The Novel and Enabling Carbon Capture Transformational Technologies FOA consists of two areas of interest, specifically:

- Development of novel transformational materials and processes; and
- Enabling technologies to improve carbon capture systems.

DOE anticipates selecting up to 14 projects focused on demonstrating the potential to provide step-change reductions in both cost and energy penalties associated with implementing carbon capture and enabling technologies for the coal and natural gas power generation sector. The projects will be managed by the National Energy Technology Laboratory (NETL).
